SCF CI PPP STUDY OF THE ELECTRONIC STRUCTURE OF ISOMERIC FORMYL BENZONAPHTHYRIDINES

Abstract: For six isomeric formyl 1,5-, 1,6- and 4,6-benzonaphthyridines the electronic structure and UV spectral values have been calculated by SCF CI PPP method, and the results have been compared with those of calculation by AMI method. Correlations of the calculated and observed wave number values show good compatibility. Molecular diagrams of considered compounds are presented.

Benzonaphthyridines (bn) and their derivatives are interesting for their reactivity and biological activities [1-5]; they are useful as 1,3-dipoles in cyclo-addition reactions [6, 7] and show complexing properties [8].

The present paper is a continuation of our research of benzonaphthyridines concerning their electronic structure and UV spectral values [9-13].

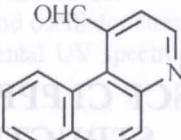

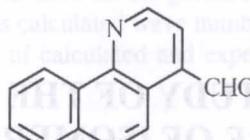

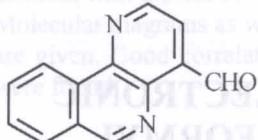

The work deals with electronic structure and UV spectral values of six isomeric formyl benzonaphthyridines 1 - 6.

1 The electronic structure 3

5

Abstract. The electronic structure 3 and 5 of 2-formyl-4,6-dihydro-2H-pyridine-3-carboxaldehyde and three dibenzodiazepinone derivatives (1, 2, 4, 6) have been calculated by the AM1 method, with the use of AM1 method for the geometry optimization.

2

4

6

For clarity the compounds 1, 3 and 5 bearing the formyl group in the *ortho* position to the ring nitrogen atom have been denoted *ortho* and 2, 4, 6 - *para* isomers.

The calculation of the electronic structure and UV spectral values has been made with SCF CI PPP method, and the results compared with those obtained by AM1 method [14]. The PPP method has been chosen having in view a rather large size of molecules under consideration. The correlations of calculated and observed UV spectra values have been made.

The calculations have been performed on a IBM PCAT computer using the Gaussian 92W program [15], and UV spectra have been recorded in 1,2-dichloroethane solution ($c=10^{-4}$ M) [14].

Wave number and oscillator strength values in the dipole length approximation of 1 - 6 are shown in Table I. Calculated and experimental UV spectra of 1 - 6 are presented in Fig. 1. The calculated and experimental UV data are given in Table 2.

The correlations of observed and calculated $\bar{\nu}$ values of 1 - 6 are shown in Fig. 2. The correlations of observed and calculated $\bar{\nu}$ values for 1 - 6 and corresponding unsubstituted bns are given in Fig. 3.

The PPP calculations (convergence of 10^{-6} eV) were performed as in our previous work [10]; the semiempirical parameters used are given in Table 3.

The correlation of observed and calculated with both methods $\bar{\nu}$ values is better for *para* than for *ortho* isomers. For observed and calculated by PPP method $\bar{\nu}$ values of 1 - 6 and corresponding unsubstituted bns the correlations

coefficients r lie in the range of 0.9811 to 0.9897, and are higher for 3 and 6 than for other isomers.

In these correlations made with the use of AMI method the r coefficients lie in the range of 0.9614 to 0.9979, and are higher for 5 and 6 as compared with other compounds [14].

The calculated by PPP method total and ionization energy values along with the dipole moments are presented in Table 4. The PPP calculations show higher total energy values, i.e. the lower stability for *ortho* compounds (1, 3, 5) than for their *para* (2, 4, 6) isomers.

The molecular diagrams of 1 - 6 calculated by PPP method are presented in Fig. 4. In molecular diagrams of 1 - 6 the electron densities of nitrogen atoms of 1,5- and 1,6-bn derivatives (1 - 4) are higher than those of 4,6-bn isomers (5 and 6); for 1,5- and 1,6-bn derivatives these values are similar. For 1 - 6 the electron densities of formyl group oxygen atoms and the C-CHO bond order values are lower for *ortho* than for *para* isomers.

The PPP calculations were carried out at the NLO level, performed as in the previous work [10], using the empirical parameters of the interaction potential.

The comparison of the observed and calculated values of $\bar{\nu}$ and $f(L)$ for the first six transitions of the resonance line observed and calculated by PPP method is shown in the upper, middle and bottom parts of the table. The correlations

Struktura elektronowa izomerycznych formylobenzonaftrydyn w obliczeniach SCF CI PPP

Streszczenie: Dla sześciu izomerycznych formylo-1,5-, 1,6- i 4,6-benzoaftrydyn obliczono strukturę elektronową i wartości dotyczące widm UV stosując metodę SCF CI PPP; wyniki porównano z obliczeniami za pomocą metody AMI. Uzyskano dobre korelacje obliczonych i doświadczalnych wartości liczb falowych. Przedstawiono diagramy molekularne rozważanych związków.
